```
import numpy as np
import pandas as pd
import sklearn
from sklearn.datasets import load_boston
df = load_boston()
     /usr/local/lib/python3.7/dist-packages/sklearn/utils/deprecation.py:87: FutureW
         The Boston housing prices dataset has an ethical problem. You can refer to
         the documentation of this function for further details.
         The scikit-learn maintainers therefore strongly discourage the use of this
         dataset unless the purpose of the code is to study and educate about
         ethical issues in data science and machine learning.
         In this special case, you can fetch the dataset from the original
         source::
             import pandas as pd
             import numpy as np
             data_url = "http://lib.stat.cmu.edu/datasets/boston"
             raw_df = pd.read_csv(data_url, sep="\s+", skiprows=22, header=None)
             data = np.hstack([raw_df.values[::2, :], raw_df.values[1::2, :2]])
             target = raw_df.values[1::2, 2]
         Alternative datasets include the California housing dataset (i.e.
         :func:`~sklearn.datasets.fetch_california_housing`) and the Ames housing
         dataset. You can load the datasets as follows::
             from sklearn.datasets import fetch_california_housing
             housing = fetch_california_housing()
         for the California housing dataset and::
             from sklearn.datasets import fetch_openml
             housing = fetch_openml(name="house_prices", as_frame=True)
         for the Ames housing dataset.
       warnings.warn(msg, category=FutureWarning)
df.keys()
     dict_keys(['data', 'target', 'feature_names', 'DESCR', 'filename',
     'data_module'])
print(df.DESCR)
     .. _boston_dataset:
```

Boston house prices dataset

Data Set Characteristics:

:Number of Instances: 506

:Number of Attributes: 13 numeric/categorical predictive. Median Value (att

:Attribute Information (in order):

- CRIM per capita crime rate by town
- ZN proportion of residential land zoned for lots over 25,000 sq
- INDUS proportion of non-retail business acres per town
- CHAS Charles River dummy variable (= 1 if tract bounds river; 0 o
- NOX nitric oxides concentration (parts per 10 million)
- RM average number of rooms per dwelling
- AGE proportion of owner-occupied units built prior to 1940
- DIS weighted distances to five Boston employment centres
- RAD index of accessibility to radial highways
- TAX full-value property-tax rate per \$10,000
- PTRATIO pupil-teacher ratio by town
- B 1000(Bk 0.63)^2 where Bk is the proportion of black people
- LSTAT % lower status of the population
- MEDV Median value of owner-occupied homes in \$1000's

:Missing Attribute Values: None

:Creator: Harrison, D. and Rubinfeld, D.L.

This is a copy of UCI ML housing dataset.

https://archive.ics.uci.edu/ml/machine-learning-databases/housing/

This dataset was taken from the StatLib library which is maintained at Carnegie

The Boston house-price data of Harrison, D. and Rubinfeld, D.L. 'Hedonic prices and the demand for clean air', J. Environ. Economics & Management, vol.5, 81-102, 1978. Used in Belsley, Kuh & Welsch, 'Regression diagnostics ...', Wiley, 1980. N.B. Various transformations are used in the table on pages 244-261 of the latter.

The Boston house-price data has been used in many machine learning papers that problems.
